

## Gateway Services

### Hosting, Networking and Gateway

Insitec has been providing hosting, private network and internet gateway services since 2002. The Insitec Gateway Environment (IGE) has been under constant development and continuous operation during that period and now supports hundreds of users across multiple organisations with a very high degree of reliability and availability. The combination of hosting provider, private network and internet gateway provides an organisation with the ability to connect all their sites to a single network, accessing all services both internally and externally, securely and efficiently. The IGE scales from small 5 user sites through to large sites with hundreds of staff without excessive cost or performance degradation.

IGE Services offered include:

- Virtual and Physical server hosting;
- Private MPLS network capability;
- Self-certified internet gateway with firewalls and proxy servers;
- DNS, Web servers, email hosting and relaying;
- Site to site VPN capability; and
- Remote access solutions

### Specialised Services

#### Server Hosting

Insitec can provide both physical and virtual hosted servers to our client. These servers can be provided either bare-metal or as a fully managed service. All hosted servers are provided within our firewall and network secured data centre environment. Within our gateway environment servers can be presented to either our private network or publicly accessible via the Internet.

#### Internet Gateway

Access to the internet and the presentation of services via the internet is critical to modern business and government. The Insitec gateway is built to the PROTECTED security classification of the Information Security Manual (ISM) with a self-certification. This security standard ensures that your network and servers are separated from security threats on the internet.

#### Private Network

Insitec runs a private broadband network that is able to provide access points throughout Australia from multiple telecommunications providers. This network is connected to our Internet Gateway and allows clients to have their own fully managed network with access to our gateway and hosting environment.

#### Remote Access Solution

The Insitec private network is an excellent means of secure communications between all areas of an organisation. However, users also need to be able to access services outside the office environment. Insitec has a secure remote access solution for either site to site private networking or for remote user access.
